Learn expert injection techniques with this multimedia reference guide to the therapeutic uses of botulinum neurotoxin A, B, and C. As many as 250,000 people in the United States have dystonia, making it the third most common movement disorder following Parkinson’s disease and cerebral palsy. This comprehensive reference details new developments in the field of neurotoxins and the clinical use of botulinum toxin (BTX)—including the biology, pharmacology, immunology, physiology, production, mechanisms of action, and methods of administration of BTX.

Among their findings, the panel recommended that (1) botulinum toxin therapy is safe and effective for treating spasticity in children and adults with cerebral palsy; (2) breast feeding and botulinum toxin therapy do not interfere; (3) the long-term effects of botulinum toxin therapy in children with cerebral palsy are unknown; and (4) the long-term effects of chronic treatment with botulinum toxin type A are not known.

Traditional neurological rehabilitation for spasticity has involved occupational and physical therapy; however, increasingly, botulinum toxin type A injections are being used to augment therapy. Congruently, understanding the safety and efficacy of physical therapies will help clinicians to better define multidisciplinary rehabilitation decisions.
